

**Listing of Claims**

*This listing of claims will replace all prior versions and listings of claims in the application. Changes to the claims are shown with additions underlined and deletions in ~~strikethrough~~.*

1. (currently amended) An apparatus, comprising:

a base member configured to be substantially parallel to a support surface;

a support member pivotally coupled to said base member, the support member movable between a first configuration in which a side of said support member is substantially perpendicular to said base member and a second configuration in which said side of said support member is substantially parallel to said base member ~~and said support surface~~; and

an extension member being movable between a first configuration in which said extension member is retracted when said support member is in the first configuration associated with said support member and a second configuration in which said extension member is coupled to said support member and angularly disposed with respect to said support member when said support member is in the second configuration associated with said support member, said extension member being configured to substantially support the weight of a user when in its second configuration.

2. (original) The apparatus of claim 1, wherein said extension member is disposed substantially beneath said base member in the first configuration.

3. (original) The apparatus of claim 1, said extension member having a first end and a second end, wherein the first end is pivotally coupled to said support member and the second end is configured to engage a support surface.

4. (currently amended) The apparatus of claim 31, said side being a first side wherein said support member further includes ~~a first side and a~~ second side, the first side configured to engage the base member when said support member is in the second configuration associated with said support member, said extension member being pivotally coupled to said support member adjacent the second side.

5. (original) The apparatus of claim 1, further comprising a plurality of actuators configured to selectively output at least one of a visual output and an audible output.

6. (currently amended) The apparatus of claim 5, wherein said plurality of actuators are actuable when said support member is in each of the first configuration and the second configuration associated with said support member.

7. (original) The apparatus of claim 5, further comprising at least one actuator coupled to said support member, the actuator being configured to output at least one of an audible output and a visual output.

8. (original) The apparatus of claim 5, wherein said plurality of actuators are configured to each output a different one of said at least one of said visual output and said audible output when contacted.

9. (original) The apparatus of claim 1, further comprising:

a first arc member coupled to opposing sides of, and extending above said base member;  
and

a second arc member coupled to the opposing sides of, and extending above said base member, the second arc member being substantially parallel to said first arc member.

10. (original) The apparatus of claim 9, further comprising:

at least one activity device, said at least one activity device being configured to be coupled to at least one of the first arc member and the second arc member.

11. (original) The apparatus of claim 9, wherein said support member is disposed substantially between said first arc member and said second arc member.

12. (currently amended) The apparatus of claim 1, wherein said extension member is disposed proximate to said support member ~~is~~ when said support member is in the first configuration associated with said support member.

13. (currently amended) ~~A convertible play center~~An apparatus, comprising:

a substantially planar base member, said base member configured to contact a support surface;

a slide member; and

an activity ~~center-member~~ including a panel, the activity ~~center-member~~ being coupled to said base member, the activity ~~center-member~~ being disposable between a first configuration in which said panel is in an upright orientation, and a second configuration in which said slide member is deployed in a usable orientation and in which said panel is configured as a step adjacent said slide member, said slide member being configured to substantially support the weight of a user when in the usable orientation.

14. (original) The apparatus of claim 13, further comprising:

a first arc member coupled to opposing sides of, and extending above said base member; and

a second arc member coupled to the opposing sides of, and extending above said base member, the second arc member being substantially parallel to said first arc member.

15. (original) The apparatus of claim 14, further comprising at least one activity device configured to be coupled at least one of said first arc member and said second arc member.

16. (currently amended) The apparatus of claim 15, wherein said activity ~~center-member~~ is disposed adjacent an edge of said base member substantially between said first arc member and said second arc member.

17. (original) The apparatus of claim 13, wherein said panel is pivotably coupled to said base member, the panel including a first surface and a second surface, the first surface configured as the step, and the second surface being positioned adjacent the base member in the second configuration.

18. (original) The apparatus of claim 17, wherein said second surface includes at least one actuator, the actuator being configured to output at least one of an audible output and a visual output.

19. (currently amended) The apparatus of claim 13, further comprising a plurality of actuators, at least one of said actuators being disposed within said activity ~~center-member~~ and configured to output at least one of a visual output and an audible output, at least one of said plurality of actuators being actuatable when said activity member is in each of said first configuration and said second configuration.

20. (original) The apparatus of claim 19, wherein said plurality of actuators are configured to selectively output at least one of a plurality of sounds contained in a memory coupled to said plurality of actuators.

21. (currently amended) The apparatus of claim 13, wherein the slide member is rotatably coupled to said base member and is disposed substantially beneath said base member when said activity member is in the second configuration.

22. (currently amended) A method, comprising:

pivoting a slide member from a retracted position to an extended position, the slide member being coupled to a substantially planar base member and configured to substantially support the weight of a user, the base member including a plurality of actuators configured to output at least one of a visual output and an audible output; and

pivoting a panel between an upright orientation and a substantially flat orientation, the panel coupled to the base member adjacent to the slide member.

23. (original) The method of claim 22, wherein the panel includes a first surface and a second surface, said pivoting the panel including contacting the second surface with the base member, the first surface being configured as a step surface when the second surface is contacting the base member.
